# Digital Signage Solutions

## Know where to go…

**Our philosophy…**

**the right information
at the right time
at the right place**

Since 1987 multitech has been developing and producing electronic information and display systems for various applications. With advancing technologies, different software versions and innovative and customized designs, we will guarantee the right solution for your digital signage requirements.

We have the desire to create the optimal symbiosis between a "point of information" and the architecture of the space for which the system is made.

H-Type 23" LW

multitech develops electronic information and display systems in a number of different versions. The combination of functionality, high-quality electronics and design are the outstanding attributes of these systems.

The H-Type was developed as the basis for this. The modular display system has all the features of a modern digital signage system. The H-Type is an elegant device, nevertheless it is robust and has been designed for continuous use. The cable routing is hidden and the digital signage players can be integrated into the housing. The devices are available in various sizes, either as wall models or as free-standing columns and can be adapted to almost all requirements.

The columns of the H-Type consist of 2 vertical stainless steel supports as standard. They can also be ordered in any color. The display mounted between the supports is equipped, like the wall displays, with a hardened and protective glass plate. The system is screwed to the floor or fitted with a base plate.

In addition to the H-Type, multitech also develops and produces a large number of other display systems in a wide variety of technologies and materials. These are very often made to customer specifications.

# LCE-3 Digital Signage Software

In order to transfer information from one or more PC workstations to different displays inside or outside a building, multitech has developed the digital signage software LCE-3. This consists of "management software" and "player software".

For creating new or managing existing contents, the LCE-3 management software will be installed on an existing server and/or workstation(s). The LCE-3 player software is always installed on a LCE-3 hardware player. This small device ensures that the contents are displayed correctly on a screen.

The user-friendly, intuitive operation and the interface to Microsoft PowerPoint allows an efficient handling of the individual tools. With just a few steps you can create the desired content and distribute it to the selected displays. You have control over which displays are connected to the network at all times. A status indicator shows whether a content is shown on the display. In addition, various connections to external databases are available.

H-Type with LCE-3 player software

The LCE-3 software package can also be ordered without displays, only with the compact plug & play players. The players will be connected to existing monitors. Depending on your needs, you can buy or rent the players and the software.
