

# Interactive Information and display systems H-Type with keypad

**Know where  
to go...**

**Our philosophy...**

**the right information  
at the right time  
at the right place**

multitech provides the H-Type not only as an exclusive display system but also with interactive functionality.

One version consists of a display, available in different sizes and with a numeric keypad for selecting various pages. All devices of the H-Type series and also most third-party products can be equipped with this tool.

With the LCE-3 Digital Signage Software the relevant contents are prepared and assigned to the display(s).

**Characteristics of these systems are:**

- instant information for the visitor
- self-explanatory queries
- easy programming by the user
- Up to 999 direct query criteria for visitors
- handicapped and child-friendly operation
- bacteria repellent keyboard (stainless steel)

# H-Type with LCE-3 Digital Signage Software and interactive functions

To transfer information from one or more workstations to different displays inside or outside a building, multitech developed the digital signage software LCE-3, which consists of a management software and a player software.

In order to create new content or administrate existing content, the management software needs to be installed on one or several Windows workstations and if desired on a server. The LCE-3 Player software is always delivered with the corresponding LCE-3 Player hardware. These compact computers ensure that the contents are displayed correctly.

The simple and intuitive operation and the use of an interface to Microsoft PowerPoint allow efficient handling of the individual tools. In just a few steps you can create the desired contents and assign them to the selected displays.

The LCE-3 software provides the possibility to assign numerical parameters to the individual contents for example, an overview page can be created on which the numbers of the subordinate pages are shown. If a visitor now presses the corresponding number on the keyboard, the associated information appears on the display. This can be a single page or a whole series of pages. The return point and the return time can also be defined.

This system can be used for a vast number of applications:

#### Hotels:

Different languages; detailed information about the hotel, for the restaurant, for the spa area, for external service providers, guidance etc.

#### Banks:

Search for exchange rates, services, interest rates, opening hours, different languages, etc.

#### Business properties

Requesting detailed information on the individual renters, guidance, Trademark query, telephone numbers of employees etc.

#### Advertising

Requesting specific information about the advertisers on a display, special promotions, QR code etc.

#### Shopping Centre:

different languages, information about the individual shops, special occasions, guidance etc.

# H-Type with LCE-3 Digital Signage Software principal structure

The system can be programmed by a single person, but also by different persons (or offices, departments or companies). Every section has the possibility to store its specific information directly and also to change it again.

The keyboard itself is placed next to the device. Depending on the application, it can be ordered in different versions:

- Indoor or outdoor
- freestanding or as wall model
- directly attached to the display (H-Type)
- Outside at a shop window (screen behind the glass) etc.

The screens can be installed in landscape or portrait format. The software will be able to control both orientations.

If desired, a visitor can use the keypad to connect to the person being searched by telephone or to trigger a visual call at the required location. Access doors or gates can also be opened.

The LCE-3 software can also be ordered without display, just with the compact plug & play player and a keyboard and connected to an existing monitor. Depending on your requirements you can buy, lease or rent these components.

## Example city administration

By pressing button 7, the system switches to the "Social" page. If the buttons 7 & 1 are then pressed, the content will switch to the "Family" page. To return to the home page, either press the 0 (back) button or the system automatically returns to the home page after a certain time. The selected number is displayed briefly as feedback for the user.
