Digital Signage Software LCE-3

LCE -3

Our philosophy ...

the right information at the right time at the right place

The LCE-3 digital signage software was designed for content creation and distribution to external screens. Various tools are available for this purpose.
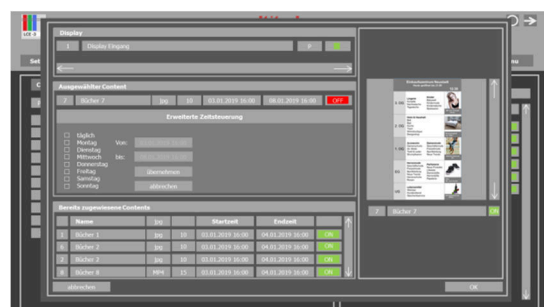

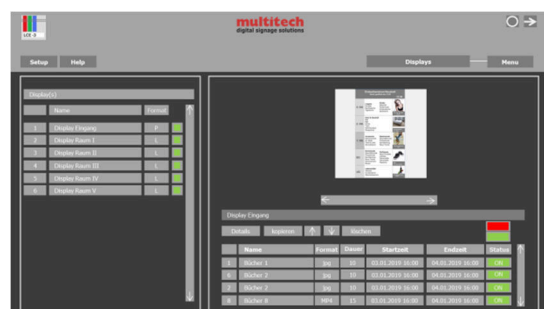

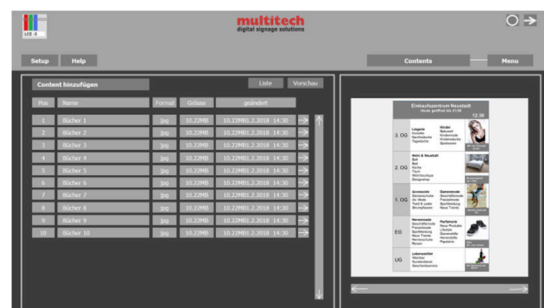

LCE-3 Management Software

The LCE-3 management software is installed on either one or more workstations. The contents are designed in conjunction with PowerPoint or other programs. Existing pictures and movies can also be managed by the software. The individual contents are sent via the time management page. The constant monitoring of the hardware ensures that the connection to the individual displays is always in place.

LCE-3 Player Software

The player software is already installed on a device. All you have to do is connecting it to a network on one side and to the screen on the other side. An HDMI connection is available to display the contents on a screen. Different formats for pictures, texts and films can be displayed time controlled. Functions such as repetitions, duration, weekdays etc. can be defined via the LCE-3 management software.
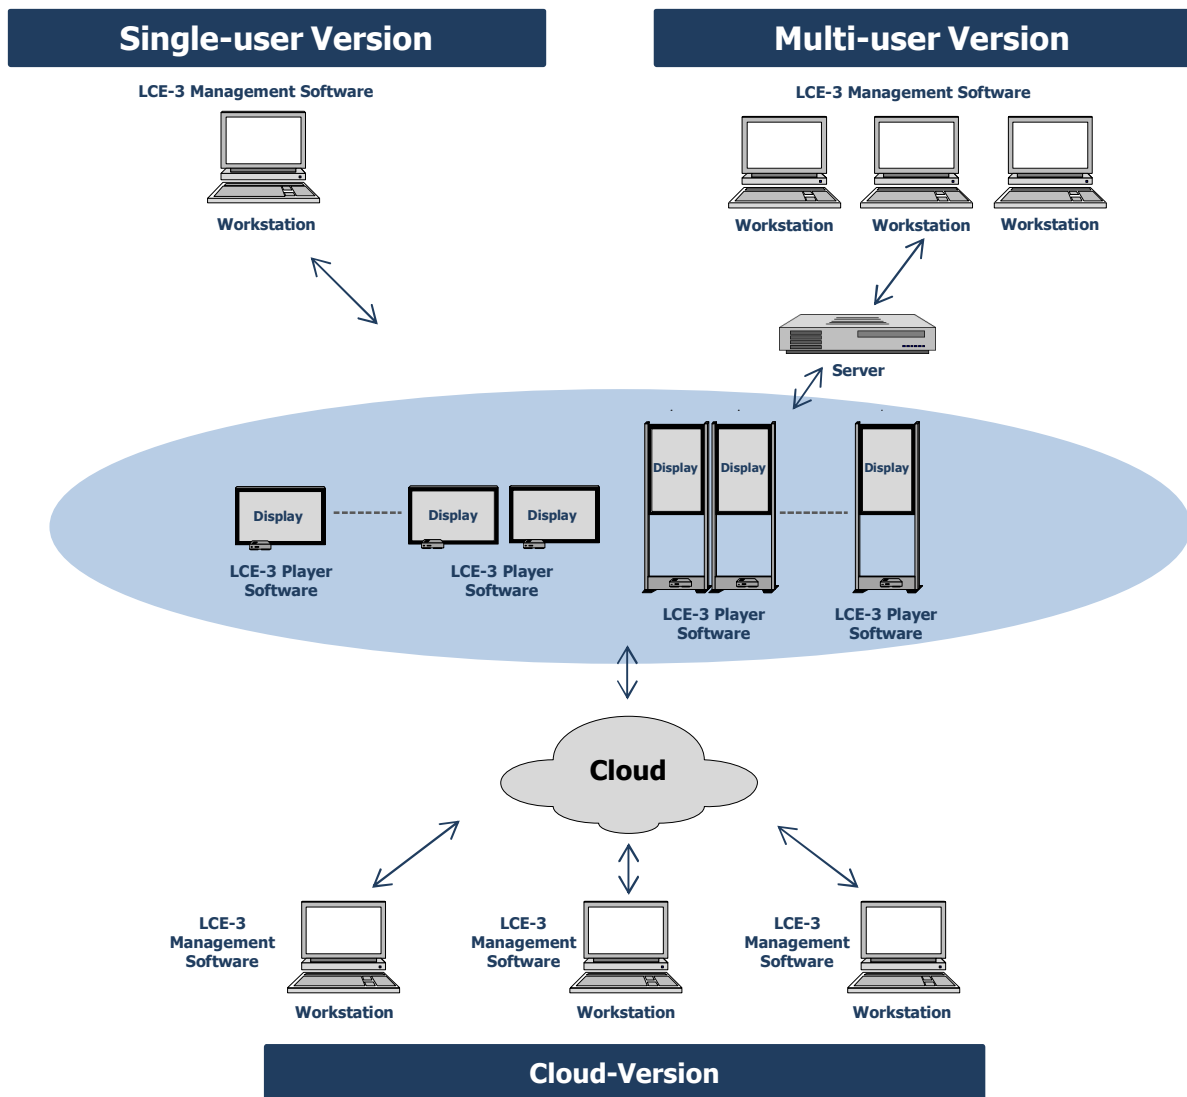

Basic menus

- Page with the directory of available contents
- Page for showing all players in the network, incl. status of the players
- Time management page for contents
- Page for setup of the system configuration

Cloud-Version

Single user version

The LCE-3 management software is installed on a Windows computer and controls the LCE-3 players via the network. The contents are stored on the same workstation and the players get the data directly from this device. The connection can be made via cable or WLAN.

Multi-user version

The LCE-3 management software is installed on several Windows computers on the same network. The files are stored on the server and each player receives the content from the server.

Cloud version

The management software LCE-3 is installed on one or more workstations at different locations. The LCE-3 Cloud is accessed via the Internet. The files are stored in the cloud. The players also receive the contents from the cloud via the Internet.
